

Static Control Mouse Pads Supplemental Instructions for Optimum Protection from Static ZAPS!

Why We Have Provided: To PROTECT the user from the annoying and sometimes painful discharges of static electricity.

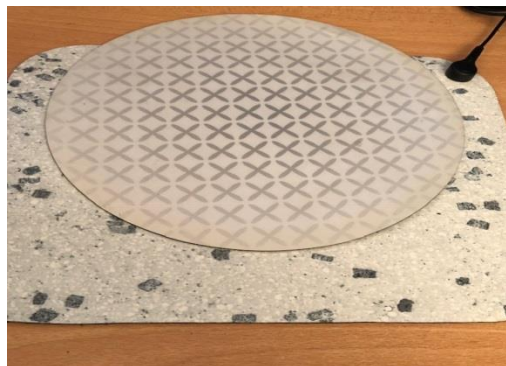

Why They Are Needed: Static electricity is a common byproduct of movement by personnel. The charge builds up on a person because it cannot get through shoes or most chair casters and go to ground. THIS is why you feel a ZAP when you touch another object OR when another object touches YOU. It will be WORSE in winter when the humidity drops.

How Do They Work: This special mouse pad is a convenient device for draining the static electricity.

When Do I need to Use Them: ALWAYS use them! Use the pad as a replacement or addition to your older mouse pad. You will not need to “remember” to use it as you are in contact with your mouse pad often when you are at your workstation.

What if I don't like the feel of the pad? Simply place your old pad over the new pad but BE SURE to leave enough of the new pad uncovered so the palm and wrist comes into contact with the NEW Pad.

Example of Old Pad Over New

Be SAFE - Take the time to comprehend and follow these instructions.
